Production Systems Engineering (PSE) is an emerging branch of Engineering intended to uncover fundamental principles of production systems and utilize them for analysis, continuous improvement, and design. This volume is the first ever textbook devoted exclusively to PSE. It is intended for senior undergraduate and

first year graduate students interested in manufacturing. The development is first principle-based rather than recipe-based. The only prerequisite is elementary Probability Theory; however, all necessary probability facts are reviewed in an introductory chapter. Using a system-theoretic approach, this textbook provides analytical solutions for the following problems: mathematical modeling of production systems, performance analysis, constrained improvability, bottleneck identification and elimination, lean buffer design, product quality, customer demand satisfaction, transient behavior, and system-theoretic properties. Numerous case studies are presented. In addition, the so-called PSE Toolbox, which implements the algorithms developed, is described. The volume includes numerous case studies and problems for homework assignment.

CAD Systems in Mechanical and Production Engineering explains the many components that make up the CAD function and how these fit and interact with other elements of the computer integrated system, especially in relation to production. The book reviews the role that computers play in engineering and production design including integration of computer systems and the incorporation of artificial intelligence in the user interface. The computer unit includes the mouse, keyboard, displays, and the whole unit uses the American Standard Code for Information Interchange (ASCII) which represents typewriter characters by a pattern of bits. The book also describes the Raster-Scan displays, plasma panels, LCDs, LEDs, and 3Ds. CAD system uses calligraphic type or raster type plotters, pen plotters, character printers for hard copies or for crude pixelated copies. The book describes the organization of CAD processors and the use of networking. The text also explains the many kinds of software and the elements of computer graphics such as rotation, two-dimensional transformations, and image realism. Management issues that can arise during the transition

from a manual to a computerized system include personnel adaptation rates and appointment of CAD personnel. The text also provides some CAD standards used in Manufacturing Automation Protocol or in Technical Office Protocol. The book is suitable for computer programmers, engineers, designers of industrial processes, and researchers involved in electrical, computer, or mechanical engineering.

This second edition of the classic textbook has been written to provide a completely up-to-date text for students of mechanical, industrial, manufacturing and production engineering, and is an indispensable reference for professional industrial engineers and managers. In his outstanding book, Professor Katsundo Hitomi integrates three key themes into the text: * manufacturing technology * production management * industrial economics Manufacturing technology is concerned with the flow of materials from the acquisition of raw materials, through conversion in the workshop to the shipping of finished goods to the customer. Production management deals with the flow of information, by which the flow of materials is managed efficiently, through planning and control techniques. Industrial economics focuses on the flow of production costs, aiming to minimise these to facilitate competitive pricing. Professor Hitomi argues that the fundamental purpose of manufacturing is to create tangible goods, and it has a tradition dating back to the prehistoric toolmakers. The fundamental importance of manufacturing is that it facilitates basic existence, it creates wealth, and it contributes to human happiness - manufacturing

matters. Nowadays we regard manufacturing as operating in these other contexts, beyond the technological. It is in this unique synthesis that Professor Hitomi's study constitutes a new discipline: manufacturing systems engineering - a system that will promote manufacturing excellence. Key Features: * The classic textbook in manufacturing engineering * Fully revised edition providing a modern introduction to manufacturing technology, production management and industrial economics * Includes review questions and problems for the student reader
