University Electron Microscopy Facility has some of the most-advanced electron microscopes, fostering innovation in the university's leadership in nanotechnology, toxicology, geochemistry, biological and materials research .

Electron-beam processing of thermoplastic material results in an array of enhancements, such as an increase in tensile strength and resistance to abrasions, stress cracking and solvents. Joint replacements such as knees and hips are being manufactured from cross-linked ultra-high-molecular-weight polyethylene because of the excellent wear characteristics due to extensive research.
